

Forklift Fork Positioners

Fork Positioner for Forklifts - The fork positioner is a hydraulic device that can allow the the one driving to be able to control the lift truck without leaving the seat. They are made out of high quality materials and are intended to be able to withstand the most difficult operations and work surroundings. Side shifting models have the added ability to be able to laterally position the entire load or the arms in order to facilitate more precise carrying and placement in a faster and much more effective way.

The unique fork pocket design could enable the person operating it to safely swing the unit's forks without any worry of damaging the positioning cylinders. This can allow the worker the option to either execute simultaneous or independent fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on available units.
